PolicyFly: Sample Project Test Plan (MASTER COPY)			Pass or Fail	Notes
Screen	Feature	Scenario Under Test		If a 'FAIL' is tied to the blue Section header, toggle it open to the failing test case for more details
Vuetify Repo				
Commits List View				
Extended Details View				
		Given, when, then		

ID	Title	Description	Repro Steps	Actual Result	Expected Result	Test Data	Example
1	After being rate-limited, pagination can go into negative page numbers	After a User has been rate-limited, the pagination becomes corrupted and it can go into the 'negative' page numbers. See screen shot in Example column.					https://d.pr/i/xycdh3
2	The 'X' for SHA search textField does not clear results	Tapping the 'X' to clear out a string in the 'SHA' textField does not actually clear anything out. It appears to have no functionality.					
3	Not all 'Authors' show up in the 'Search by Contributor' dropDownMenu	There are a handful of 'Authors' who do not show up in the 'Search by Contributor' menu, therefore, they are not searchable. The following Authors, for an example, are not searchable: gaberzz, acu192, donniewa					
4	Returning back to listView from detailsView takes me to beginning of data set BUT the page number remains what it previously was	If a user taps into a detailsView for a commit, upon returning to the listView via the 'back' arrow, the pagination data is reset to the beginning, but the pagination number remains where you left off at. It causes a mismatch between the data set and the pagination count					

5	No error on the UI when an 'SHA' is not found	If a user searches for an SHA that cannot be found, there's a 404 error behind the scenes, but no corresponding error message on the UI. The user has no idea that the SHA could not be found.		{
				  "message": "Not Found",
				  "documentation_url": "https://developer.github.com/v3/repos/commits/#list-commits-on-a-repository"
				}			

6	SHA Searching does not filter ONLY on the SHA provided	If a user searches for an SHA that returns results, the results set is not filtered based on an exact match of the SHA entered. I see the					
7	Don't expose 'Next' button if results set is only one page	If an Author only returns one page of results, disable the 'Next' button so they cannot paginate because no data will be available					
8	Author 'Sort' controls do not persist across the entire data set	If a user invokes the 'Sort' toggle for Authors, it does not sort the entire data set available, it appears to only sort the authors on the current screen			I would expect the entire data set to be sorted based on ascending or descending control, but it appears it only sorts the data based on the current screen you're on, which is confusing to a user		
9	Author/commit message sort doesn't persist across page refresh	If a user changes the order (e.g. descend to ascend) and then does a page refresh in the browser, the sort order reverts to its original order, not what it was just changed to					
10	class="v-list__tile does not exist when the viewport is less than 1264 pixels wide	If the viewport is under 1264 pixels wide, the entire v-list__tile class disappears. The User cannot select 'Commits' in order to search, sort, and filter the listView
